

PERSIMILIS

Phytoseiulus persimilis is used for the prevention, control, and management of spider mites. These mites will **wipe out spider mite colonies** by feeding on all mite stages. They have a fast reproduction rate and eat more eggs and mobile stages of spider mite than any other predatory mite.

CROPS

Citrus, grapes, dates, cannabis, pome fruit, blueberries, strawberries & various vegetable crops.

EFFECTIVE AGAINST

Two spotted spider mite (*Tetranychus urticae*)
 Carmine spider mite (*Tetranychus cinnabarinus*)

STORAGE

Available in:
 25k, 50k, 100k, 500k

APPLICATION INSTRUCTIONS

The adults can be stored 24 hours prior to release if necessary but not for longer than 2 days.

- Persimilis are sold & supplied in adult form.
- Sprinkle the contents of the bottle on leaves of affected plants/trees at head height & if possible, in close proximity to mites.
- Once the applied, the adult mites will start dispersing immediately and start looking for prey.

RELEASE TIPS

Persimilis are best released in early spring & summer, before mite populations build up to high levels. In Citrus orchards, releases should be considered after the spring complex sprays are complete. Do not release Persimilis too soon after applying toxic chemicals & avoid harsh chemical applications after insects are introduced.
